

Video Services

Provided by certified legal video specialists, The Data Company's full range of services includes proprietary services such as forensic video.

Video Depositions

This is one of our core services — and our objective is to capture testimony without losing the impact of dynamic events. We shoot with broadcast-quality cameras and come fully equipped with audio control, wireless lapel microphones, monitors, lighting supplements and background shades. We can also create an audio recording for court reporters.

Editing

We can professionally edit any video you bring to us or that we make for you. Analog or digital, we employ a number of video editing hardware and software solutions. Our technicians and producers are highly skilled and are qualified to create programs that are compelling, succinct and tell a story.

Video Conferencing Suites

When you need to connect remotely with clients or partners, we offer the technology, privacy and amenities you need to conduct your business professionally. Our video conferencing equipment is the most advanced available. A one-to-one link connects you with one other office. Or, take advantage of our one-to-many video links, which create up to 10 simultaneous connections.

Certified Legal Video Specialists

All of our video technicians are fully qualified Certified Legal Video Specialists (CLVS) with the expertise to create compelling — and admissible — videos.

Forensic Video

With video cameras everywhere these days, it is frequently possible to find a camera that recorded an incident, but making the images understandable requires a skilled technician with the right tools — and we have both. We have one of the few technologies outside of the FBI and other agency crime labs that will enhance surveillance video into a clear and understandable film.

Digital Encoding

We can take any analog videotape or film and transfer it to a digital format for computer access. We take great care in preserving the image and audio quality so that you can trust the digital results. We can load your video to a digital repository, synchronize it with the same ASCII text created by the court reporter, and allow you to select the video sequences you need — simply by using the page and line number from the transcript.
